Development Readiness Preparation

Start Assignment

- Due Sunday by 11:59pm
- Points 50
- Submitting a website url

Deliverable

Submit **one link per team to your project repository** containing your completed Development Readiness materials, including:

- Your project specification `.md` files
- Your `AGENTS.md` or equivalent, when applicable
- Your prepared development environment
- Your first implementation task and the agent's proposed implementation plan

Your repository will be used during the **Project Go/No-Go Review** the following week.

1. Create Your Project Specifications

Use your **previous assignments, prototypes, client discussions, and other approved project decisions** to create concise documentation in your repository.

For a typical web application, this might include:

```
docs/
├── architecture.md
├── data-model.md
├── api.md
├── security.md
└── design/
    ├── ui-spec.md
    └── user-flows.md
```

These specific files are not required. Determine what documentation is appropriate for your project.

Your documentation might address:

- **Architecture** — major components, technologies, responsibilities, and interactions
- **Data Model** — entities/documents, fields, relationships, and constraints
- **API / Interfaces** — important interfaces between components
- **Security & Privacy** — authentication, authorization, data handling, and important constraints
- **UI/UX** — design system, prototype references, interactions, and user flows
- **Project-specific concerns** — model pipelines, hardware interfaces, external integrations, communication protocols, or other important design decisions

A useful question to ask is:

> **What does a developer need to know to implement our system without making important design decisions on our behalf?**

Document those things.

---

2. Configure Your Agentic Development Environment

When permitted by your client, create an `AGENTS.md` or equivalent persistent instructions for your development tool.

Remember:

> **Project documentation describes what the solution is. `AGENTS.md` describes how the agent should work within that solution.**

Your agent instructions should identify:

- Where authoritative project specifications are located
- Important development and architectural constraints
- How the agent should approach nontrivial tasks
- How changes should be tested and verified
- What the agent should do when requirements are unclear

Do not duplicate all of your project documentation inside `AGENTS.md`. Point the agent to the appropriate sources instead.

---

3. Prepare Your Development Environment

Make sure your repository is ready for development.

As appropriate for your project, this may include:

- Application/framework setup
- Dependency and environment management
- Database and migration tooling
- Testing
- Linting, formatting, or type checking
- Build processes
- CI/CD

A developer or agent should be able to determine **how to run the project and how to verify changes**.

4. Prepare Your First Implementation Task

Select the first meaningful task your team intends to complete once you are approved to begin development.

This will often come from the **Global Setup & Infrastructure** portion of your Iteration Plan, such as implementing your approved database, establishing authentication, or creating another shared project foundation.

The task should have a clear scope and acceptance criteria.

When agentic development is permitted, ask your agent to:

1. Read the task and relevant project specifications.
2. Investigate the existing repository.
3. Propose an implementation plan.
4. **Stop before implementing the plan.**

Review the proposed plan as a team. Be prepared to explain whether the plan correctly follows your requirements and design and what, if anything, you would change.

Using AI for This Assignment

When permitted by your client, **you may use AI tools to help create your project documentation and agent instructions**.

In fact, using an agent to inspect your existing project and previous work and help draft these documents can be an effective way to complete this assignment.

However, your team must **read, review, and correct everything it produces**.

AI-generated documentation may contain incorrect assumptions, invented requirements, contradictions, omissions, or unnecessary information.

If it is in your repository, your team owns it.

Every team member should understand the documentation and be prepared to explain the decisions it represents.

Before You Submit

Your team should be able to answer **yes** to the following:

- Are our important design and technical decisions documented?
- Are those documents consistent with our previous assignments and approved designs?
- Can a developer or agent find the information needed to implement our project?
- Does our agent know where to find authoritative project information?
- Can the project be run and changes verified?
- Is our first implementation task clearly defined?
- Have we reviewed the agent's proposed implementation plan?
- Does every team member understand what we are proposing to build?

Your repository does **not** need to be perfect. It needs to demonstrate that your team is prepared to begin implementation deliberately rather than handing unresolved design decisions to an agent.

Next week, your team will use this work during the Project Go/No-Go Review.

Criterion	Points	What to Evaluate
Project Specifications	**15**	Repository contains clear, implementation-ready specifications derived from prior requirements, research, designs, and technical decisions. Important decisions are documented rather than left for the agent to determine.
Agent / Development Configuration	**10**	`AGENTS.md` or equivalent provides useful persistent instructions, identifies authoritative project documentation, establishes important constraints, and explains how work should be approached and verified.
Development Environment & Verification	**5**	Project is ready for development. The team can run the system and has appropriate project-specific mechanisms for testing, builds, linting, validation, or other verification.
First Implementation Task & Agent Plan	**10**	First meaningful implementation task has clear scope and acceptance criteria. The agent has investigated the repository and proposed a plan, and the team has critically reviewed that plan before implementation.
Team Understanding & Readiness	**10**	Team can explain its architecture, design/data decisions, specifications, agent configuration, and planned implementation approach. Responses demonstrate that the team—not the agent—owns the important engineering decisions.
Total	**50**	

Agentic Development Readiness Rubric

Criteria	Ratings					Pts
Project Specifications Repository contains clear, implementation-ready specifications derived from prior requirements, research, designs, and technical decisions. Important decisions are documented rather than left for the agent to determine.	**15 pts** **Exceeds**	**11.25 pts** **Mastery**	**7.5 pts** **Near**	**3.75 pts** **Below**	**0 pts** **No Evidence**	15 pts
Agent / Development Configuration AGENTS.md (http://AGENTS.md) or equivalent provides useful persistent instructions, identifies authoritative project documentation, establishes important constraints, and explains how work should be approached and verified.	**10 pts** **Exceeds**	**7.5 pts** **Mastery**	**5 pts** **Near**	**2.5 pts** **Below**	**0 pts** **No Evidence**	10 pts
Development Environment & Verification Project is ready for development. The team can run the system and has appropriate project-specific mechanisms for testing, builds, linting, validation, or other verification.	**5 pts** **Exceeds**	**3.75 pts** **Mastery**	**2.5 pts** **Near**	**1.25 pts** **Below**	**0 pts** **No Evidence**	5 pts
First Implementation Task & Agent Plan First meaningful implementation task has clear scope and acceptance criteria. The agent has investigated the repository and proposed a plan, and the team has critically reviewed that plan before implementation.	**10 pts** **Exceeds**	**7.5 pts** **Mastery**	**5 pts** **Near**	**2.5 pts** **Below**	**0 pts** **No Evidence**	10 pts

Criteria	Ratings					Pts
Team Understanding & Readiness Team can explain its architecture, design/data decisions, specifications, agent configuration, and planned implementation approach. Responses demonstrate that the team—not the agent—owns the important engineering decisions.	**10 pts** **Exceeds**	**7.5 pts** **Mastery**	**5 pts** **Near**	**2.5 pts** **Below**	**0 pts** **No Evidence**	10 pts
